Dear Editors and Reviewers,

please find attached our paper entitled “A Review on Blockchain for the Internet of Medical Things: Definitions, Challenges, Applications, and Vision”, to be considered for publication in Computer Communications.

The paper move the attention over the Internet of Medical Things solution centered on final users. We will go through the current challenges for the Smart Health applications to be coupled with blockchain in order to move forward an idea of blockchain-based implementations in which the system should be independent from the Healthcare providers and more user-centric (or patient centric, describing it from the medical position).

Best regards,

Gioele Bigini, Valerio Freschi, and Emanuele Lattanzi
